ABSTRACT OF THE DISCLOSURE

10 Information handling system peripheral cables are managed with a cable clip
guide that couples to and extends from the peripheral stand. The cable clip guide
includes a support arm that extends substantially perpendicular from the support stand
to maintain a ring in a substantially parallel alignment with the support stand. The
ring inner circumference guides the cables from the support in a desired direction and
is sized to allow movement of the cable through the ring in response to movement of
15 the peripheral, such as the raising, lowering or rotating of a flat panel display. An
opening formed from the inner to the outer circumference is sized to retain cables
within the ring, however, flexing of the ring increases the opening to allow passage of
cables into and out of the ring.
